

Chess Project Description

In this project, a chess game has been designed that has two modes of single player and double player. In single player mode, based on the player's movements, the system takes into account several variables, including the exposure of the pieces, the possibility of falling, etc., for a possible movement, considers a point and makes the best move in front of the player. In two-person mode, two people can record their movements and play

How to play?

To start the game, first enter your preferences based on what is asked. Then the blue color (white in reality) should start.

To start and move your piece, first right-click the piece, then press enter. Then choose your destination and again press enter.

Note: If no change is happening, and you cannot move your piece, double press enter to cancel previous chooses and redo the process again.

You can play either with the pre-defined bot or play a multiplayer game with another person.
